Supplement of

Forcing for varying boundary layer stability across Antarctica

Supplemental Information

Table S1: Number of BMUs, mean downwelling longwave radiation (W m$^{-2}$) and mean 20 m wind speed (m s$^{-1}$) (from left to right, separated by a forward slash (/) in each column) for each regime annually and seasonally at South Pole. Rows that list the basic near-surface stability regimes are shown with gray shading. Regimes with less than 10 observations annually or seasonally are listed in italics and red text. A triple dash ("---") indicates this regime is not observed annually or seasonally.

</table>
Figure S1: Distribution downwelling shortwave radiation observed for each regime at South Pole annually (left panel) and seasonally (right four panels – summer, fall, winter, and spring). Box plots show median downwelling shortwave radiation (horizontal line), 25th and 75th percentiles (edges of boxes), mean downwelling shortwave radiation (center black star), and 10th and 90th percentiles (whiskers) for each stability regime for annual and seasonal periods. The thin vertical black lines in the figure separate the stability groupings in each panel (annual or seasonal). The numbers at the top indicate the number of radiosonde profiles in each regime.
Figure S2: Distribution downwelling shortwave radiation observed for each regime at Dome C annually (left panel) and seasonally (right four panels – summer, fall, winter, and spring). Box plots show median downwelling shortwave radiation (horizontal line), 25th and 75th percentiles (edges of boxes), mean downwelling shortwave radiation (center black star), and 10th and 90th percentiles (whiskers) for each stability regime for annual and seasonal periods. The thin vertical black lines in the figure separate the stability groupings in each panel (annual or seasonal). The numbers at the top indicate the number of radiosonde profiles in each regime.
Figure S3: Distribution downwelling shortwave radiation observed for each regime at McMurdo annually (left panel) and seasonally (right four panels – summer, fall, winter, and spring). Box plots show median downwelling shortwave radiation (horizontal line), 25th and 75th percentiles (edges of boxes), mean downwelling shortwave radiation (center black star), and 10th and 90th percentiles (whiskers) for each stability regime for annual and seasonal periods. The thin vertical black lines in the figure separate the stability groupings in each panel (annual or seasonal). The numbers at the top indicate the number of radiosonde profiles in each regime.
Figure S4: Distribution downwelling shortwave radiation observed for each regime at Neumayer annually (left panel) and seasonally (right four panels – summer, fall, winter, and spring). Box plots show median downwelling shortwave radiation (horizontal line), 25th and 75th percentiles (edges of boxes), mean downwelling shortwave radiation (center black star), and 10th and 90th percentiles (whiskers) for each stability regime for annual and seasonal periods. The thin vertical black lines in the figure separate the stability groupings in each panel (annual or seasonal). The numbers at the top indicate the number of radiosonde profiles in each regime.
Figure S5: Distribution downwelling shortwave radiation observed for each regime at Syowa annually (left panel) and seasonally (right four panels – summer, fall, winter, and spring). Box plots show median downwelling shortwave radiation (horizontal line), 25th and 75th percentiles (edges of boxes), mean downwelling shortwave radiation (center black star), and 10th and 90th percentiles (whiskers) for each stability regime for annual and seasonal periods. The thin vertical black lines in the figure separate the stability groupings in each panel (annual or seasonal). The numbers at the top indicate the number of radiosonde profiles in each regime.
Figure S6: Summary of the mean downwelling shortwave radiation for the near-surface stability regimes at all five sites annually (a) and seasonally: summer, fall, winter, and spring (b through e).
Figure S7: Distribution of surface wind direction observed for each regime at Syowa annually (left panel) and seasonally (right four panels – summer, fall, winter, and spring). Box plots show median wind direction (horizontal line), 25th and 75th percentiles (edges of boxes), mean wind direction (center black star), and 10th and 90th percentiles (whiskers) for each stability regime for annual and seasonal periods. The thin vertical black lines in the figure separate the stability groupings in each panel (annual or seasonal). The numbers at the top indicate the number of radiosonde profiles in each regime.
