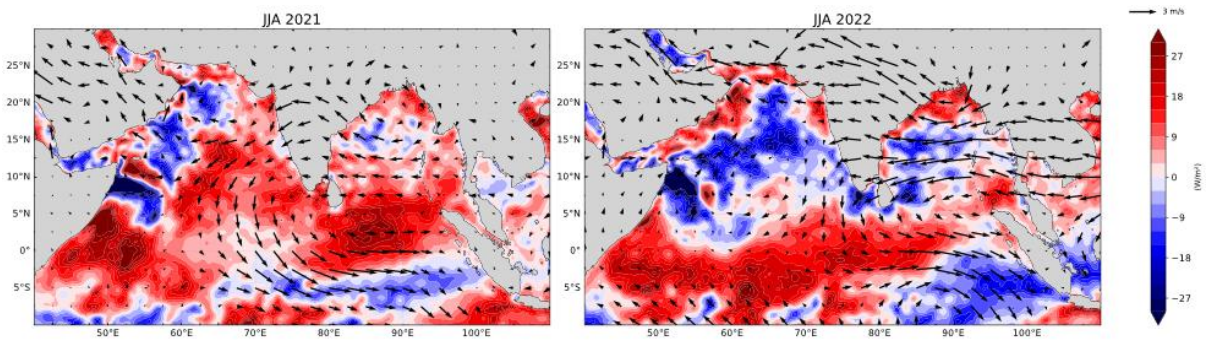
This document contains Supplementary Figure S1.



Supplementary Figure S1: The anomalous June-July-August (JJA) mean low-level circulation at 850 hPa and the latent heat flux anomalies for the years 2021 and 2022. A negative anomaly indicates reduced evaporative cooling. The JJA anomalies are computed from ERA5 data (https://www.ecmwf.int/en/forecasts/dataset/ecmwf-reanalysis-v5) for the period 1980-2022.
