Supplementary Figures

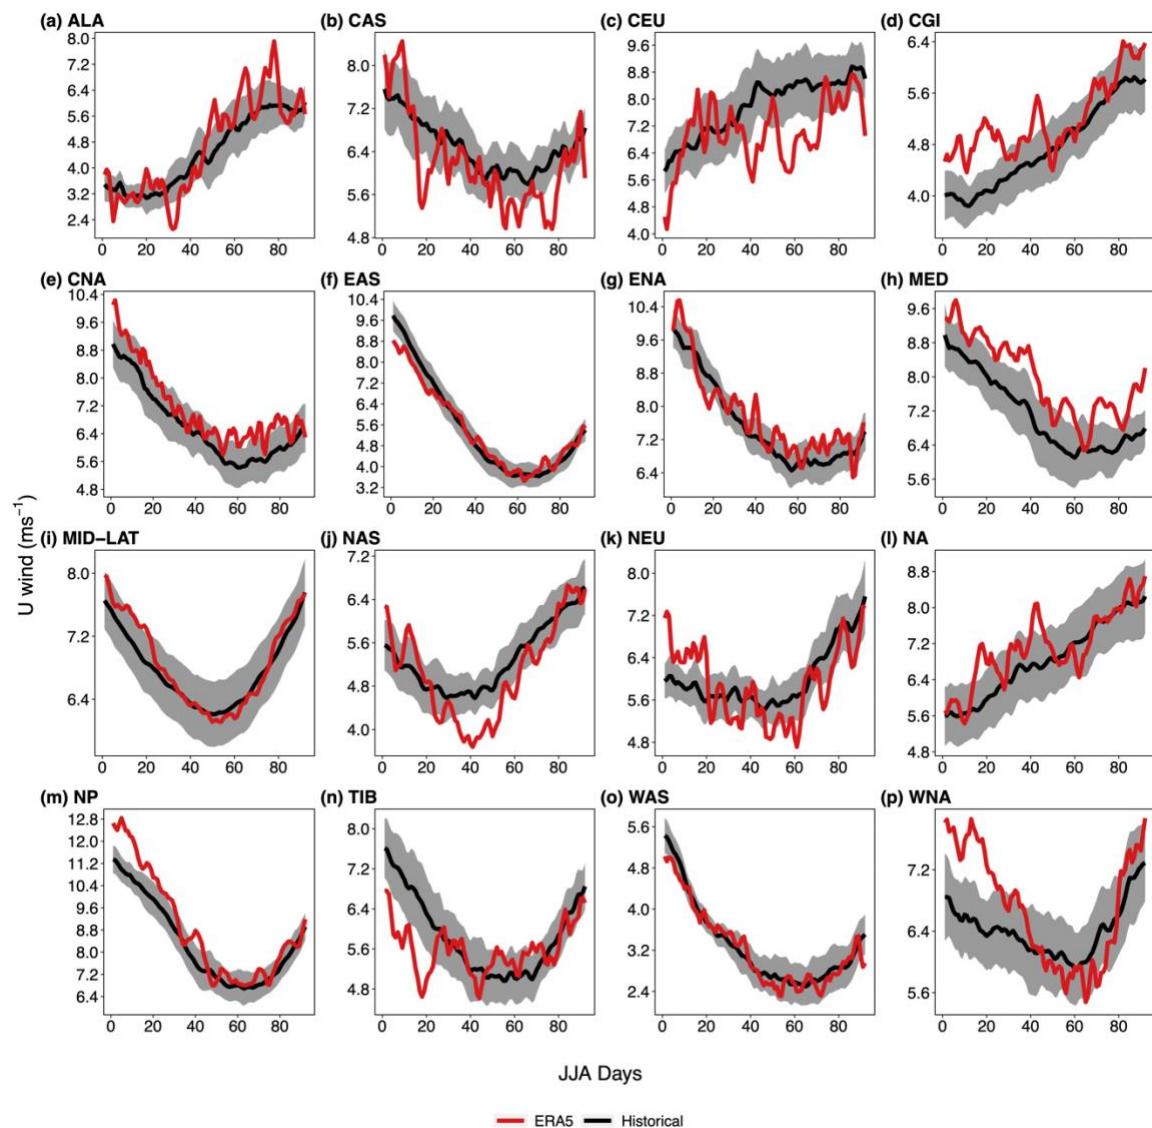

Figure S1. As Figure 2(b)-(q) but for U wind (ms^{-1}).

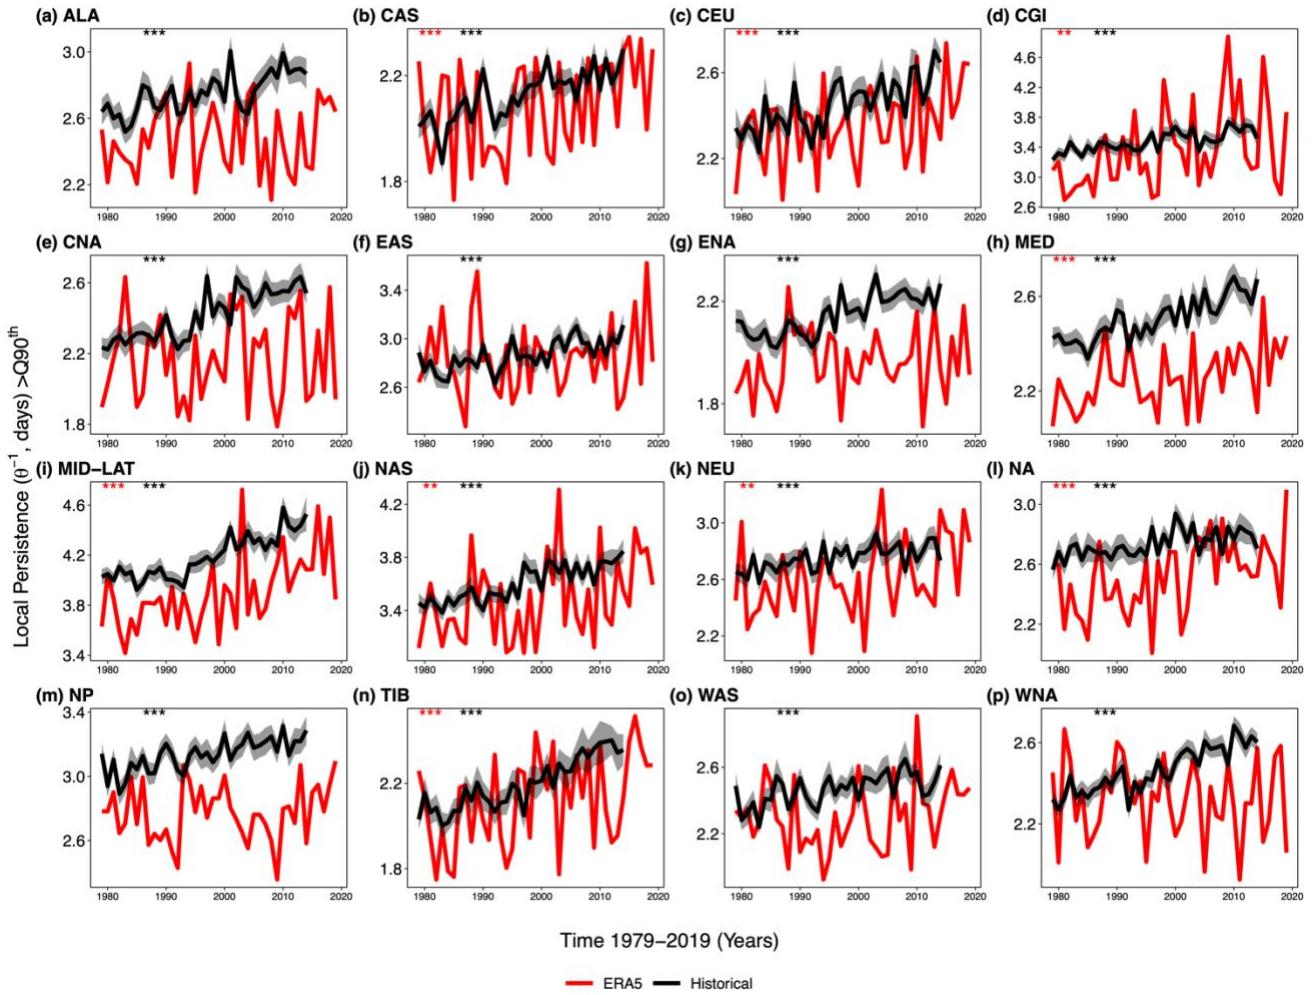

Figure S2. As Figure 3 but for trends in extreme persistence (exceeding the 90th percentile). See also Table S3.

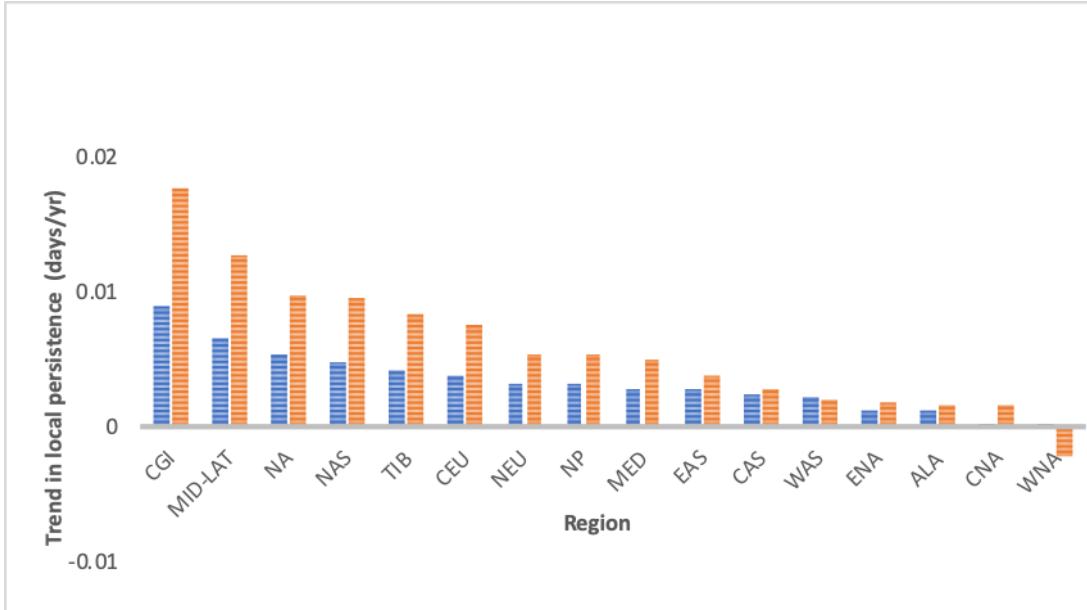

Figure S3. Comparison between trends in mean (blue) and 90th percentile (orange) persistence in ERA5 over 1979-2019.
Regions are ordered according to the magnitude of the mean trend.

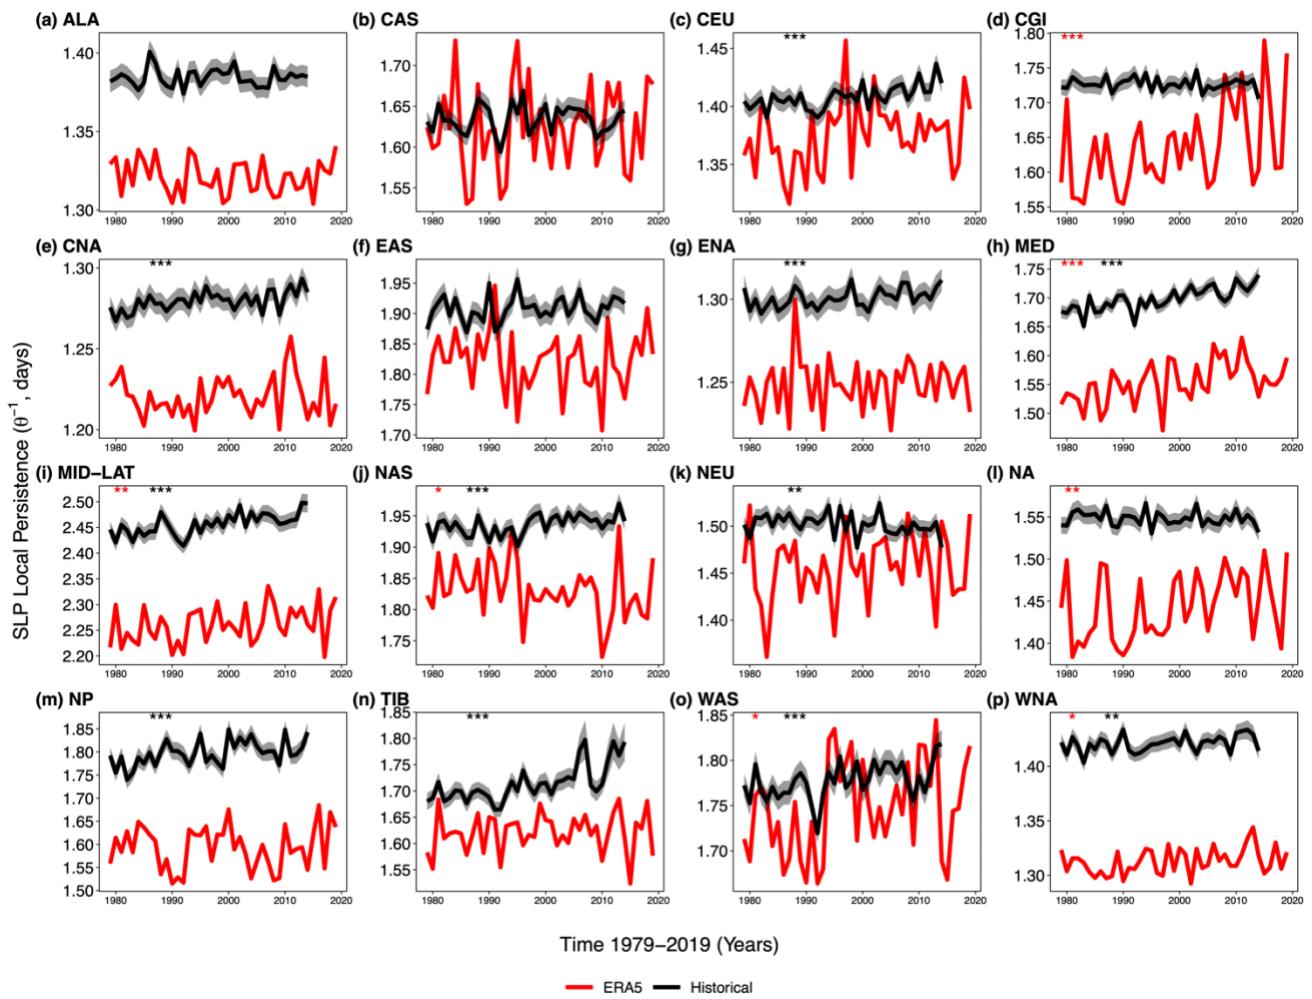

Figure S4. As Figure 3 but for daily sea-level pressure (SLP) persistence. See also Table S4.

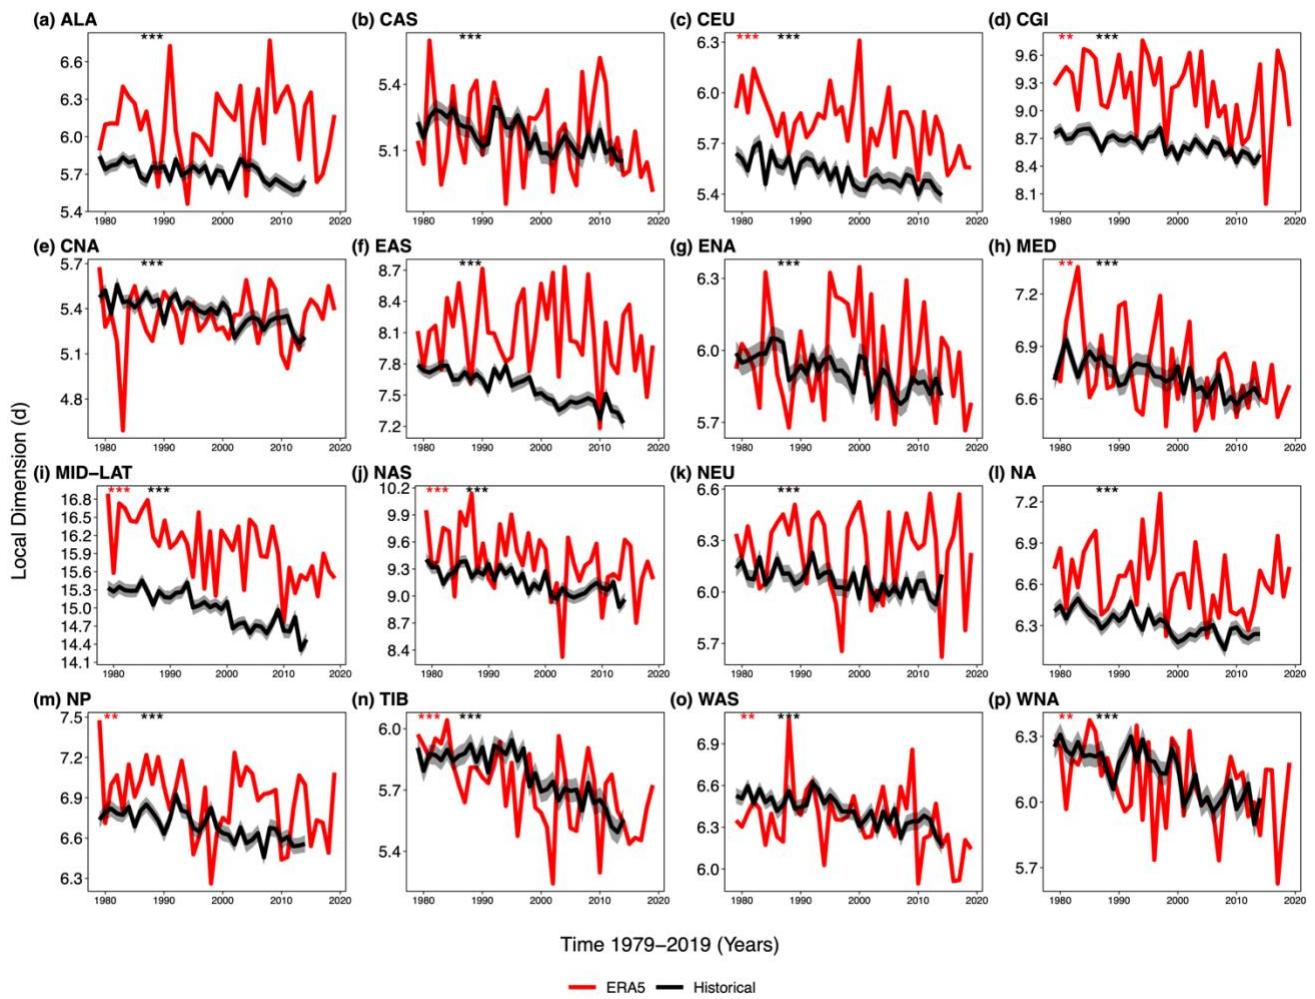

Figure S5. As Figure 3 but for the other dynamical systems metric local dimension (d).

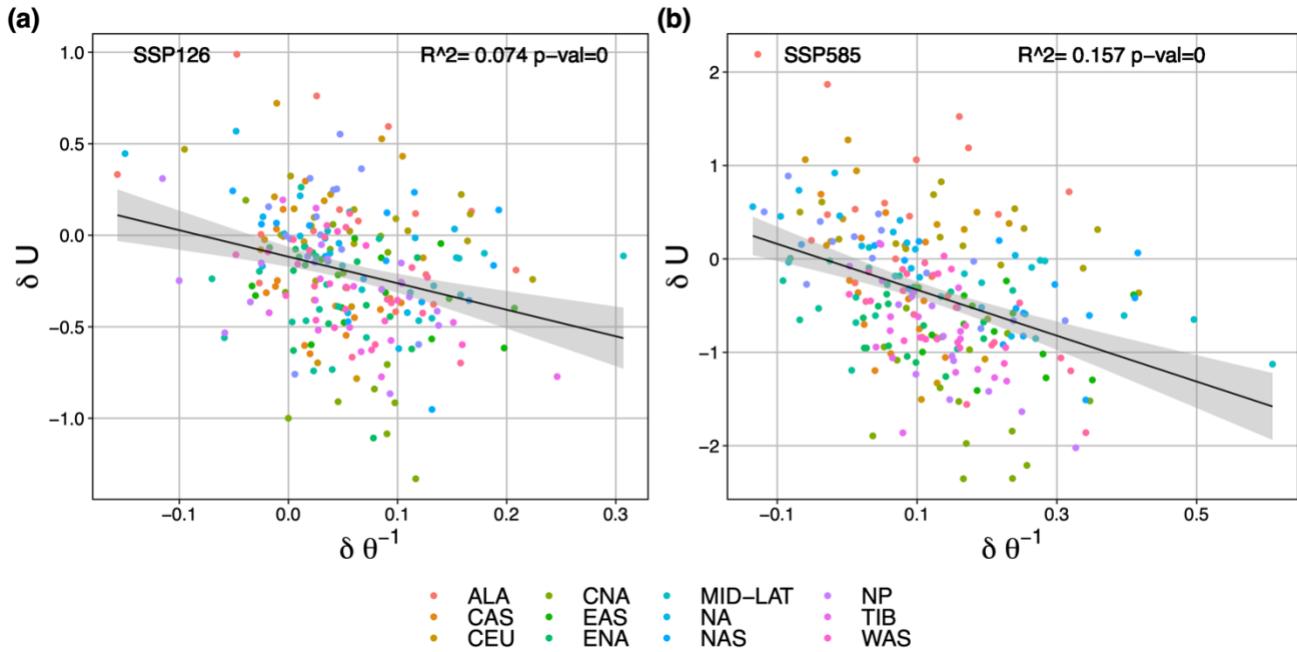

Figure S6: Regression analyses between future changes in the July-August zonal wind (δU) and persistence ($\delta \theta^{-1}$) for SSP126 (left) and SSP585 (right) for mid-latitude regions (coloring). δU and $\delta \theta^{-1}$ are computed by subtracting historical values (mean over 1981-200) from the two SSPs (mean over 2081-2100). Grey shaded areas represent the 95% confidence intervals of the linear regressions.

Table S7. Local persistence change ($\delta\theta_{-1}$) and p-values of CMIP6 MMM SSP126 and SSP585 (2081-2100) compared with Historical (1981-2000). Statistical significance was assessed with a Mann-Whitney test (one-tailed) under the null hypothesis that the SSPs persistence values are greater than the Historical's. The Table refers to Figure 4.
